

Clickmox – Mechatronics Engineering Intern:

I worked at Clickmox Solutions as a Mechatronics Engineering Intern from January 2017 to May 2017. The company's main focus is to develop Scanning systems for mines capable of scanning hard to access area. Clickmox uses drones, carts and other types of remote control vehicles to access those areas. While working there I was directly involved in designing and developing several of their products. One of the earliest products that I worked on is available in the market right now and others are under development.
